

The MySudo Suite

"The best defense against data breaches is not being in the database."

Powered by Anyome Labs™

The MySudo Suite is the consumer product offering from Anyome Labs, a privacy and identity protection company trusted by Fortune 100 companies, backed by more than 22 issued patents, and building innovative proactive privacy and identity protection solutions for enterprises and consumers for over a decade.

The MySudo Suite

A family of four independent privacy and identity protection products, each built and operated by Anyome Labs. Every product stands on its own, with its own plans and pricing. They're designed to work even better together.

Users can subscribe to any one product or all four. There's no requirement to use MySudo to access MySudo VPN, MySudo Reclaim, or MySudo Password. Each is priced and sold independently.

What connects them is a shared philosophy: privacy should be proactive, structural, and accessible. Not a policy promise. Not a monitoring service that tells you what's already gone wrong.

MySudo

Create up to 9 digital identities with real working phone numbers, email inboxes, encrypted communication, virtual cards, and private browsers. No personal information required to sign up. From \$1.99 per month.

MySudo VPN

Zero-log encrypted VPN across 76 servers in 41 countries. No username, password, or phone number required to connect. From \$6.99 per month.

MySudo Reclaim

AI-powered inbox scanner that maps your data exposure and helps you take it back, account by account. From \$9.99/month.

MySudo Password

Coming soon. One secure vault for every credential, including your Sudo details. One master key that never leaves your device.

What it Looks Like in Practice:

Start with **MySudo**. Create up to nine separate digital identities, called Sudos, each with a real working phone number, email address, virtual card, private browser, and encrypted messaging calling and video. These aren't placeholders. They're fully functional credentials that represent you without exposing you. They become the details you share with the world instead of your personal information. Use them across shopping, work, dating apps, side projects, or anywhere you'd rather not hand over your details. Your personal information stays private because it was never shared in the first place.

Use **MySudo Reclaim** to clean up what's already out there. Scan your inbox, see exactly which companies have your personal data, find out if any of it has been breached, and take action. Delete the accounts you don't need and update the ones you want to keep with your Sudo credentials instead. Now those companies have your Sudo information on file, not your personal details.

MySudo Password, coming soon, keeps every login organized in one secure vault, including your Sudo credentials, and autofills them wherever you need. No reused passwords. No scrambling to remember what you used where. No passwords needed with passkeys. One master password you control with a "hide my email" style aliasing feature that will be introduced in a future release.

MySudo VPN wraps it all with an encrypted connection wherever you go. No logs. No tracking. No one watching what you do online.

Together, they cover every layer. Build your digital identities with MySudo. Clean up the past with MySudo Reclaim. Secure and autofill your credentials with MySudo Password. Encrypt your connection with MySudo VPN. You can start with any one of them or all of them.

Zero-Knowledge Architecture:

Every product in the MySudo Suite is designed so Anonymome Labs never needs to hold user personal information.

MySudo requires no PII to create an account. The VPN keeps no usage logs. Reclaim processes data without storing it. The password manager uses a master key that never leaves the user's device.
